

FOR IMMEDIATE RELEASE

Periodic Products Announces Rare Earth Element Study Findings Published

Fort Lauderdale, FL – December 18, 2015

Periodic Products Inc. today announced that the results of its study on the extraction of rare earth elements from phosphates has been [published](#) by the Florida Industry and Phosphate Research Institute (FIPR).

The study, *The Extraction and Recovery of Rare Earth Elements from Phosphate using PX-107 and Chelok Polymers*, confirmed that the Company's technology successfully recovers rare earth elements (REEs) from waste by-products produced during fertilizer manufacturing. The study demonstrated that the Company's technology produced yields equal to those currently obtained from mining raw ore containing REEs, and further isolated two commercially important rare earth elements – neodymium and lanthanum – in high concentrations.

The study was co-funded by Periodic Products and FIPR, a scientific research center created by the Florida State Legislature. The results of the study are available on the [FIPR website](#).

“We are pleased with the results of this initial study,” said Dr. Joseph Laurino, president and CEO of Periodic Products. “The study demonstrates our technology's capacity to extract and recover these valuable rare earth metals.”

When fully implemented, the company's technology could recover nearly 120,000 tons of rare earth metals – the current United States annual demand – according to Laurino.

About Periodic Products

Periodic Products is committed to advancing a cleaner and safer global environment through the application of responsible science and breakthrough chemical technologies. Chelok® is Periodic Products' patented chelating technology, and gives Periodic Products' family of polymers the power to rapidly and permanently remove metals from water. For additional information on our technologies, visit www.periodicproducts.com.
