

OVERVIEW

Periodic Products is a Fort Lauderdale based biotechnology company founded in 2009 by Dr. Joseph P. Laurino. The Company's mission is to maximize the commercial potential of a series of unique, versatile, and biodegradable polymer compounds that can both bind metal contaminants in water and serve as polycarbonate resins. As the world's only highly efficient insoluble binders of toxic heavy metals, these compounds provide significant benefits for the remediation of groundwater and surface water contaminated with toxic metals. Further, these compounds are the only water insoluble polymers known to chemically bond with metal surfaces. Five series of domestic and international patent applications have been filed on this technology, with two U.S. and five international patents granted to date. The Company currently markets and sells five products containing these polymer compounds in the swimming pool and spa market. These products, all marketed under the CuLator® brand, are sold by over 30 distributors in the United States and Canada, and are available at more than 1100 retail outlets (including Leslie's Pool Mart and Pinch-A-Penny stores) across the country.

The flexibility of these novel polymer compounds allow for significantly better, cost-effective technological solutions across a broad spectrum of industries. These include treating and purifying drinking water and industrial waste water; reclaiming toxic land and groundwater; and preventing metal corrosion.

Additionally, the Company has acquired the assets of Vitalflor, Inc. of Lake Mary, Florida. These assets include three U.S. patents and one Canadian patent on supravital fluorescence technology for the determination of biological contaminants in fluids and solids.
